No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 16,

                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 43780, Application US/11056355B

Sequence 43780, Application US/11056355B

Publication No. US20060150283A1

GENERAL INFORMATION:

APPLICANT: Brover, Vyacheslav

APPLICANT: Braxandrov, Nickolai

TITLE OF INVENTION: Sequence Determined DNA Fragments and Corresponding

TITLE OF INVENTION: Sequence Determined DNA Fragments and Corresponding

TITLE OF INVENTION: Polypeptides Encoded Thereby

FILE REFERENCE: 2750-1590PUS2

CURRENT APPLICATION UNMBER: 08/11/056,355B

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The present invention provides alpha-1,3/4-fucosyltransferase (also termed as fucosyltransferase) proteins and nucleic acids from various strains of Helicobacter pylori. This enzyme catalyzes the transfer of a fucose residue from a donor substrate to an acceptor substrate. The fucosyltransferase polynucleotides and polypeptides are useful for the synthesis of oligosaccharides, glycoproteins and glycolipids. The present sequence is Helicobacter pylori fucosyltransferase protein.

The invention relates a purified transmembrane segment-free alpha 1,3-

tucosyltransferase polyapeptide, having a repeat of the sequence: X 1-X 2-

Leu-Arg-X.3-X 4-Tyr, where X 1, X 2 and X 4 is Asp or Ash, and X 3 is

Leu-Arg-X.3-X 4-Tyr, where X 1, X 2 and X 4 is Asp or Ash, and X 3 is

Leu-Arg-X.3-X 4-Tyr, where X 1, X 2 and X 4 is Asp or Ash, and X 3 is

Is, Val or Ala. Also included are the nucleic acid encoding the protein

CG (including the complement or fragment), a vector containing the nucleic

acid, a host cell containing nucleic acid or vector, an antibody which

producing transmembrane segment-free alpha1, 3- fucosyltransferase,

comprising a host cell modified with the nucleic acid or its

comprising a host cell modified with the nucleic acid or its

compraising the produced oligosaccharides, such as Lex, Ley or SLex, by

contacting the produced oligosaccharides, such as Lex, Ley or SLex, by

contacting the bost cell with a substrate, to produce oligosaccharides

and purifying the obtained oligosaccharides. The nucleic acid is useful

contacting the obtained oligosaccharides. The nucleic acid is useful

as probe for detecting the nucleic acid, by contacting a sample with a

cucleic acid probe that hybridises to alpha1,3-fucosyltransferase

contacting the nucleic acid, by contacting a sample with

a probe for detecting hybridises to alpha1,3-fucosyltransferase

contacting the nucleic acid wilm polymerase chain reaction (PCR). The

mulifying the nucleic acid wilm polymerase chain reaction (PCR). The

cucypltransferase-fusion prodein, by growing the host cell containing a

The invention relates a purified transmembrane segment-free alpha 1,3-
[the cost) transferase polypeptide, having a repeat of the sequence: X 1-X 2-
[the cost) transferase polypeptide, having a repeat of the sequence: X 1-X 2-
[the Nag-X 3-X 4-Tyr, where X 1, X 2 and X 4 is hap or Asn; and X 3 is
[the Nag-X 3-X 4-Tyr, where X 1, X 2 and X 4 is hap or Asn; and X 3 is
[the Nag-X 3-X 4-Tyr, where X 1, X 2 and X 4 is hap or Asn; and X 3 is
[the Nag-X 3-X 4-Tyr, where X 1, X 2 and X 4 is hap or Asn; and X 3 is
[the Nag-X 3-X 4-Tyr, where X 1, X 2 and X 4 is hap or Asn;

Lieurny 1 of Ala. Also included are the nucleic acid encoding the protein (including its complement or fragment), a vector containing the nucleic acid, a host cell containing nucleic acid or vector, an antibody which selectively binds to the protein and a gene expression system for selectively binds to the protein and a gene expression system for selectively binds to the protein and a gene expression system for comprising a host cell modified with the nucleic acid or its enzymatically active portion. The protein and cells are useful for producing fucosylated oligosaccharides, such as LackAc-R and GDP-fucose, and purifying the protein with a substrate such as LackAc-R and GDP-fucose, and purifying the protein with a substrate, to produce oligosaccharides and purifying the obtained oligosaccharides. The nucleic acid is useful as a probe for acteting the nucleic acid, by contacting a sample with a contacting the nucleic acid why pridisation of the probe; or by contacting the nucleic acid wing polymerase chain reaction (PCR). The colymucleotide, and detecting hybridisation of the probe; or by contacting a sample with a colymucleotide and and arranemembrane segment-free alphal.3-thosyltransferase-fusion protein, by growing the host cell containing a vector operably linked to a polymucleotide encoding a desired polympetice or peptide under conditions which allow expression and secretion of the fusion protein in a sample. The presence of the protein in the
                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       fucosyltransferase polypeptide, having a repeat of the sequence: X 1-X 2-Leu-Arg-X 3-X 4-Tyr, where X 1, X 2 and X 4 is Asp or Asn; and X 3 is Ile, Val or Ala. Also included are the nucleic acid encoding the protein

sample is indicative of infection by Helicobacter pylori or the presence of malignant cells. The antibody is also useful for diagnosing disease and for inhibiting abnormal alphal, 3-fucosyltransferase gene product activity. The nucleic acid is useful as part of ribozyme and/or triple helix sequences and for alphal, 3-fucosyltransferase gene regulation. Oligosaccharides synthesised using the protein or cell are useful in the development of assays to detect mammalian tumours. The present sequence represents an H. pylori alphal, 3 fucosyltransferase encdoed by the fucT gene. (Updated on 29-AUG-2003 to standardise OS field)

This is the amino acid sequence of the novel alpha-1,3-
fucosyltransferase of Helicobacter pylori NCTC 11639, as deduced from the
newly isolated fuc7 gene (see AA80321). The enzyme is characterised by 8
C-terminal heptad repeats and by the lack of a transmembrane domain. The
absence of a transmembrane domain allows the enzyme to be readily
released from recombinant host cells. The enzyme can be used in the
production of fucosylated oligosaccharides such as Lewis X, Lewis Y and
sialyl Lewis X, which are structurally similar to certain tumour
associated antigens found in mammals. These glycoconjugates also have
mammalian tumours. The enzyme can also be used to raise specific
antibodies. Inhibition of abnormal fucT gene product activity can be used
for the treatment of intestinal mucosal disease. (Updated on 17-OCT-2003)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Enzyme, fucT, alphal, 3 fucosyltransferase, oligosaccharide; Lex; Ley, sLex; Helicobacter pylori infection, malignant cell; mammalian tumour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                            New isolated alpha-1-3-fucosyltransferase gene - obtained from Helicobacter pylori, used to develop products for the diagnosis and treatment of intestinal mucosal diseases, e.g. tumours.

The invention describes a complex of protein-protein interactions in Helicobacter pylori selected from 421 complexes given in the specification. The complex of protein-protein interactions are useful for screening for agents which modulate the interaction of proteins. Modulating compounds which binds to a targeted bacterial protein may be used for treating or preventing ulcers in a human or animal. This is the amino acid sequence of a selected interacting domain (SID), identified via protein-protein interactions. Note: Where the patent number printed at the top of the pages in the specification has obscured areas of protein sequence, the indexer has replaced the residue with an X to

                                                                                                                                                                                                                                                                                                                                                                                      producing fucosylated oligosaccharides, such as Lex, Ley or slex, by contacting the protein with a substrate such as Lex, Ley or slex, by contacting the protein with a substrate such as Lex, Ley or slex, by contacting the protein with a substrate, to produce oligosaccharides, and purifying the produced oligosaccharides. The nucleic acid is useful as a probe for detecting the nucleic acid, by contacting a sample with a nucleic acid probe that hybridises to alpha1,3-fucosyltransferase colly producing polymerase chain reaction (PCR). The amplifying the nucleic acid using polymerase chain reaction (PCR). The host cell is useful for producing a transmembrane segment-free alpha1,3-fucosyltransferase-fusion protein, by growing the host cell containing a vector operably linked to a polymuclectide encoding a desired polymerable containing a vector operably linked to a polymuclectide encoding a desired polymerable containing a vector operably linked to a polymuclectide encoding a desired polymerable containing a vector operably linked to a polymuclectide encoding a desired polymerable containing a cuestion protein and isolating the fusion protein. The antibody is useful and is in the sample, the protein in the sample is indicative of inferrior why uslice the protein in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                     The invention relates a purified transmembrane segment-free alpha 1,3-fucosyltransferase polypeptide, having a repeat of the sequence: X_1-X_2-lea-Argy.X_3-X_4-Tyr, where X_1, X_2 and X_4 is a hap or Asn; and X_3 is lle, Val or Ala. Also included are the nucleic acid encoding the protein (including its complement or fragment), a vector containing the nucleic acid, a host cell containing nucleic acid or vector, an antibody which selectively binds to the protein and a gene expression system for producing transmembrane segment-free alphal, 3-fucosyltransferase, comprising a host cell modified with the nucleic acid or its
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            fucosyltransferase gene product activity. The nucleic acid is useful as part of ribozyme and/or triple helix sequences and for alphal, 3-fucosyltransferase gene regulation. Oligosaccharides synthesised using the protein or cell are useful in the development of assays to detect mammalian tumours. The present sequence represents an H. pylori alphal, 3 fucosyltransferase enclosed by the fucT gene. (Updated on 29-AUG-2003 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       sample is indicative of infection by Helicobacter pylori or the presence of malignant cells. The antibody is also useful for diagnosing disorders and monitoring disease, and for inhibiting abnormal alphal, 3-

Helicobacter pylori selected from 421 complexes given in the specification. The complex of protein-protein interactions are useful for secening for agents which modulate the interaction of proteins. Modulating compounds which binds to a targeted bacterial protein may be used for treating or preventing ulcers in a human or animal. This is the amino acid sequence of a selected interacting domain (SID), identified via protein-protein interactions. Note: Where the patent number printed at the top of the pages in the specification has obscured areas of protein sequence, the indexer has replaced the residue with an X to

Purified transmembrane segment-free alphal, 3-fucosyltransferase polypeptide useful for producing fucosylated oligosaccharides.

Example 3; Fig 6; 37pp; English.

The invention relates a purified transmembrane segment-free alpha 1,3fucosyltransferase polypeptide, having a repeat of the sequence: X 1-X 2fucusyltransferase polypeptide, having a repeat of the sequence: X 1-X 2fueu-MFGY.X 3-X 4-Tyr, where X 1, X 2 and X 4 is Asp or Asn; and X 3 is

Ile, Val Or Ala. Also included are the mucleic acid encoding the protein

(including its complement or fragment), a vector containing the nucleic

acid, a host cell containing nucleic acid or vector, an antibody which

acid, a host cell containing nucleic acid or vector, an antibody which

producing transmembrane segment-free alphal, 3- fucosyltransferase,

comprising a host cell modified with the nucleic acid or its

comprising a host cell modified with the nucleic acid or its

producing fucosylated oligosacharides, such as Lac. Ley or SLex, by

contacting the protein with a substrate such as Lac. Ley or SLex, by

contacting the produced oligosaccharides, or by culturing the cell,

and purifying the obtained oligosaccharides. The nucleic acid is useful

se a probe for detecting the nucleic acid, by contacting a sample with a

```
nucleic acid probe that hybridises to alphal, 3-fucosyltransferase
polymucleotide, and detecting hybridisation of the probe; or by
amplifying the nucleic acid using polymerase chain reaction (PCR). The
host cell is useful for producing a transmembrane segment-free alphal, 3-
fucosyltransferase-fusion protein, by growing the host cell containing a
ceftor operably linked to a polymucleotide encoding a desired polypeptide
or peptide under conditions which allow expression and secretion of the
fusion protein and isolating the fusion protein. The antibody is useful
ce fusion protein and isolating the fusion protein. The antibody is useful
ce family and the protein in a sample. The presence of the protein in the
sample is indicative of infection by Helicobacter pylori or the presence
of malignant cells. The antibody is also useful for diagnosing disorders
of monitoring disease, and for inhibiting abnormal alphal, 3-
fucosyltransferase gene product activity. The nucleic acid is useful as
part of ribozyme and/or triple helix sequences and for alphal, 3-
the protein or cell are useful in the development of assays to detect
mammalian tumours. The present sequence represents an H. Pylori alphal, 3-
choosyltransferase entedoed by the fuct gene. (Updated on 29-MG-2003 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

(NEOS-) NEOSE TECHNOLOGIES INC.

Johnson KF, Bezila DJ;

WPI; 2004-123401/12. N-PSDB; ADJ77819. New isolated polynucleotide encoding fucosyltransferase protein, us for synthesizing oligosaccharide moiety on a protein or lipid that unglycosylated in its native form or for synthesizing glycolipids.

Claim 12; SEQ ID NO 12; 72pp; English.

This invention relates to novel isolated polynucleotides and the encoded polypeptides thereof, which are related to the fucosyltransferase enzymes firth and FuED of Helicobacter pylori (H. pylori). Specifically, it refers to alpha 1-3/4 fucosyltransferase enzymes that can be used to chemically synthesise glycoproteins and glycolipids with the desired

NO: 12

888888888888

```
New isolated fucosyltransferase polynucleotides and polypeptides, useful for synthesizing oligosaccharides, glycoproteins, or glycolipids.

                                                                                                                                                                                                                                                                      ö
oligosaccharide moieties (i.e. by transfer of a fucose residue to Nacetylglucosamine), such that they are useful in the preparation of glycoconjugates. The present invention describes how bacterial fucosyltransferase is unaffected by the sialyation status of the acceptor sugar, as opposed to the mammalian homologue, and furthermore, and encrymes offer a large cost saving relative to mammalian expression systems. This polypeptide sequence is an H. pylori strain 26695 FutA protein sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence represents an alpha-1,3/4-fucosyltransferase protein which was used in the method of the invention for producing a fucosylated glycoprotein. The method involves contacting a recombinant fucosyltransferase protein with a mixture comprising a donor substrate which comprises a fucosyl residue, and an acceptor substrate on a slycoprotein, under conditions such that the fucosyltransferase protein catalyzes the transfer of the fucosy residue from a donor substrate to the acceptor substrate on the glycoprotein. The method is useful for producing fucosylated glycoprotein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Producing fucosylated glycoprotein, by contacting recombinant fucosyltransferase protein with mixture comprising donor substrate and acceptor substrate on glycoprotein.
                                                                                                                                                                                                                                                                      Gaps

The present invention provides alpha-1,3/4-fucosyltransferase (also termed as fucosyltransferase) proteins and nucleic acids from various strains of Helicobacter pylori. This enzyme catalyzes the transfer of a fucose residue from a donor substrate to an acceptor substrate. The fucosyltransferase polynucleotides and polypeptides are useful for the synthesis of oligosaccharides, glycoproteins and glycolipids. The present sequence is Helicobacter pylori fucosyltransferase protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The invention describes a complex of protein-protein interactions in Helicobacter pylori selected from 421 complexes given in the specification. The complex of protein-protein interactions are useful for serening for agents which modulate the interaction of proteins. Modulating compounds which binds to a targeted bacterial protein may be used for treating or preventing ulers in a human or animal. This is the amino acid sequence of a selected interacting domain (SID), identified via protein-protein interactions. Note: Where the patent number printed at the top of the pages in the specification has obscured areas of represent an illegible residue
                                                                                                                                                                                                                                              New complexes of protein-protein interactions in Helicobacter pylori, useful for identifying modulating compounds for treating or preventing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Protein-protein interaction; ulcer; selected interacting domain; SID
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Helicobacter pylori selected interacting domain (SID) protein #909.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention describes a complex of protein-protein interactions in Helicobacter pylori selected from 421 complexes given in the specification. The complex of protein-protein interactions are useful for screening for agents which modulate the interaction of proteins. Modulating compounds which binds to a targeted bacterial protein may be used for treating or preventing ulcers in a human or animal. This is the
                                                                                                                                   The invention describes a complex of protein-protein interactions in Helicobacter pylori selected from 421 complexes given in the specification. The complex of protein-protein interactions are useful for screening for agents which modulate the interaction of proteins. Modulating compounds which modulate the interaction of proteins used for treating or preventing ulcers in a human or animal. This is the amino acid sequence of a selected interacting domain (SID), identified via protein-protein interactions. Note: Where the patent number printed at the top of the pages in the specification has obscured areas of protein sequence, the indexer has replaced the residue with an X to represent an illegible residue
                        New complexes of protein-protein interactions in Helicobacter pylori, useful for identifying modulating compounds for treating or preventing ulcers in mammals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New complexes of protein-protein interactions in Helicobacter pylori, useful for identifying modulating compounds for treating or preventing

Labigne A;

De Reuse H,

Colland F,

amino acid sequence of a selected interacting domain (SID), identified via protein-protein interactions. Note: Where the patent number printed at the top of the pages in the specification has obscured areas of protein sequence, the indexer has replaced the residue with an X to represent an illegible residue 888888
